#### **Sending Destination via Bluetooth**

To send the point selected by NaviCon to the car navigation system via Bluetooth, you need to set up pairing between your smartphone and the car navigation system.

Pairing determines the combination of connected devices (Pair). The following pages introduce specific procedures.

\*The screen details and design may differ from the actual product.

There is a type of Bluetooth connection called a "Profile" which requires pairing for each purpose.

Typical ones are for telephones (HFP) and for music playback (A2DP), but for NaviBridge to send a destination, you need to pair for data communication (SPP)

Some car navigation systems perform multiple pairing at the same time.

#### Connection

Once pairing is complete, the connection is automatically made the next time.

When NaviBridge is connected to the car navigation system, the indicator at the bottom right of the map screen changes to green "ONLINE".

\*In some rare cases, pairing information may be lost depending on the usage situation. In this case, delete the entry from both your smartphone and car navigation and try pairing again.

## **Car navigation**

Select "  $\land$  "  $\rightarrow$  "Settings"  $\rightarrow$  "Phone"  $\rightarrow$  "Add Device".
